What are they?

So far, most proofs involving terms have been by induction on the structure of terms.

Logical relations are relations between well-typed terms defined inductively on the structure of types. They allow proofs between terms by induction on the structure of types.

Unary relations

- Unary relations are predicates on expressions
- They can be used to prove type safety and strong normalisation

Binary relations

- Binary relations relates two expressions of related types.
- They can be used to prove equivalence of programs and non-interference properties.

Logical relations are a common proof method for programming languages.

Normalization of simply-typed $\lambda$-calculus

Types usually ensure termination of programs—as long as neither types nor terms contain any form of recursion.
Normalization of simply-typed $\lambda$-calculus

Types usually ensure termination of programs—as long as neither types nor terms contain any form of recursion.

Even if one wishes to add recursion explicitly later on, it is an important property of the design that non-termination is originating from the constructions introduced especially for recursion and could not occur without them.
Normalization of simply-typed $\lambda$-calculus

Types usually ensure termination of programs—as long as neither types nor terms contain any form of recursion.

Even if one wishes to add recursion explicitly later on, it is an important property of the design that non-termination is originating from the constructions introduced especially for recursion and could not occur without them.

The simply-typed $\lambda$-calculus is also lifted at the level of types in richer type systems such as System $F^\omega$; then, the decidability of type-equality depends on the termination of the reduction at the type level.
Normalization of simply-typed $\lambda$-calculus

Types usually ensure termination of programs—as long as neither types nor terms contain any form of recursion.

Even if one wishes to add recursion explicitly later on, it is an important property of the design that non-termination is originating from the constructions introduced especially for recursion and could not occur without them.

The simply-typed $\lambda$-calculus is also lifted at the level of types in richer type systems such as System $F^{\omega}$; then, the decidability of type-equality depends on the termination of the reduction at the type level.

The proof of termination for the simply-typed $\lambda$-calculus is a simple and illustrative use of logical relations.

Notice however, that our simply-typed $\lambda$-calculus is equipped with a call-by-value semantics. Proofs of termination are usually done with a strong evaluation strategy where reduction can occur in any context.
Normalization

Proving termination of reduction in fragments of the $\lambda$-calculus is often a difficult task because reduction may create new redexes or duplicate existing ones.

Hence the size of terms may grow (much) larger during reduction. The difficulty is to find some underlying structure that decreases.

We follow the proof schema of Pierce [2002], which is a modern presentation in a call-by-value setting of an older proof by Hindley and Seldin [1986]. The proof method is due to [Tait, 1967].
Calculus

Take the call-by-value simply-typed $\lambda$-calculus with primitive booleans and conditional.

Write $B$ the type of booleans and $tt$ and $ff$ for \textit{true} and \textit{false}.

We define $\mathcal{V}(\tau)$ and $\mathcal{E}(\tau)$ the subsets of closed values and closed expressions of type $\tau$ by \textbf{induction on types} as follows:

$$
\mathcal{V}(B) \triangleq \{tt, ff\}
$$

$$
\mathcal{V}(\tau_1 \to \tau_2) \triangleq \{\lambda x: \tau_1. M | \lambda x: \tau_1. M : \tau_1 \to \tau_2 \land \forall V \in \mathcal{V}(\tau_1), M V \in \mathcal{E}(\tau_2)\}
$$

$$
\mathcal{E}(\tau) \triangleq \{M | M : \tau \land \exists V \in \mathcal{V}(\tau), M \rightarrow^* V\}
$$

The goal is to show that any closed expression of type $\tau$ is in $\mathcal{E}(\tau)$.

\textbf{Remarks}

$\mathcal{V}(\tau) \subseteq \mathcal{E}(\tau)$—by definition.

$\mathcal{E}(\tau)$ is closed by inverse reduction—by definition, \textit{i.e.}

If $M : \tau$ and $M \rightarrow N$ and $N \in \mathcal{E}(\tau)$ then $M \in \mathcal{E}(\tau)$. 
Problem

We wish to show that every closed term of type $\tau$ is in $E(\tau)$

- Proof by induction on the typing derivation.
- Problem with abstraction: the premisse is not closed.

We need to strengthen the hypothesis, *i.e.* also give a semantics to open terms.

- The semantics of open terms can be given by abstracting over the semantics of their free variables.
Generalize the definition to open terms

We define a semantic judgment for open terms $\Gamma \vdash M : \tau$ so that $\Gamma \vdash M : \tau$ implies $\Gamma \models M : \tau$ and $\emptyset \models M : \tau$ means $M \in E(\tau)$.

We interpret free type variables of type $\tau$ as closed values in $V(\tau)$.

We interpret environments $\Gamma$ as mappings $\gamma$ from type variables to \textit{closed values}:

We write $\gamma \in G(\Gamma)$ to mean $\text{dom}(\gamma) = \text{dom}(\Gamma)$ and $\gamma(x) \in V(\tau)$ for all $x : \tau \in \Gamma$.

$$\Gamma \vdash M : \tau \overset{\text{def}}{\iff} \forall \gamma \in G(\Gamma), \gamma(M) \in E(\tau)$$
Fundamental Lemma

**Theorem (fundamental lemma)**
If $\Gamma \vdash M : \tau$ then $\Gamma \models M : \tau$.

**Corollary (termination of well-typed terms):**
If $\emptyset \vdash M : \tau$ then $M \in E(\tau)$.

That is, closed well-typed terms of type $\tau$ evaluates to values of type $\tau$. 
Proof by induction on the typing derivation

Routine cases

Case $\Gamma \vdash \text{tt} : B$ or $\Gamma \vdash \text{ff} : B$: by definition, $\text{tt}, \text{ff} \in \mathcal{V}(B)$ and $\mathcal{V}(B) \subseteq \mathcal{E}(B)$.

Case $\Gamma \vdash x : \tau$: $\gamma \in \mathcal{G}(\Gamma)$, thus $\gamma(x) \in \mathcal{V}(\tau) \subseteq \mathcal{E}(\tau)$

Case $\Gamma \vdash M_1 M_2 : \tau$:

By inversion, $\Gamma \vdash M_1 : \tau_2 \rightarrow \tau$ and $\Gamma \vdash M_2 : \tau_2$.

Let $\gamma \in \mathcal{G}(\Gamma)$. We have $\gamma(M_1 M_2) = (\gamma M_1)(\gamma M_2)$.

By IH, we have $\Gamma \vdash M_1 : \tau_2 \rightarrow \tau$ and $\Gamma \vdash M_2 : \tau_2$.

Thus $\gamma M_1 \in \mathcal{E}(\tau_2 \rightarrow \tau)$ (1) and $\gamma M_2 \in \mathcal{E}(\tau_2)$ (2).

By (2), there exists $V \in \mathcal{V}(\tau_2)$ such that $\gamma M_2 \rightarrow^* V$.

Thus $(\gamma M_1) (\gamma M_2) \rightsquigarrow (\gamma M_1) V \in \mathcal{E}(\tau)$ by (1).

Then, $(\gamma M_1) (\gamma M_2) \in \mathcal{E}(\tau)$, by closure by inverse reduction.

Case $\Gamma \vdash \text{if } M \text{ then } M_1 \text{ else } M_2 : \tau$: By cases on the evaluation of $\gamma M$.
Proof by induction on the typing derivation

The interesting case

Case $\Gamma \vdash \lambda x : \tau_1. M : \tau_1 \rightarrow \tau$

Assume $\gamma \in \mathcal{G}(\Gamma)$.
We must show that $\gamma(\lambda x : \tau_1. M) \in \mathcal{E}(\tau_1 \rightarrow \tau)$ (1)

That is, $\lambda x : \tau_1. \gamma M \in \mathcal{V}(\tau_1 \rightarrow \tau)$ (we may assume $x \notin \text{dom}(\gamma)$ w.l.o.g.)

Let $V \in \mathcal{V}(\tau_1)$, it suffices to show $(\lambda x : \tau_1. \gamma M) V \in \mathcal{E}(\tau)$ (2).

We have $(\lambda x : \tau_1. \gamma M) V \rightarrow (\gamma M)[x \mapsto V] = \gamma' M$
where $\gamma'$ is $\gamma[x \mapsto V] \in \mathcal{G}(\Gamma, x : \tau_1)$ (3)

Since $\Gamma, x : \tau_1 \vdash M : \tau$, we have $\Gamma, x : \tau_1 \vdash M : \tau$ by IH. Therefore by (3), we have $\gamma' M \in \mathcal{E}(\tau)$. Since $\mathcal{E}(\tau)$ is closed by inverse reduction, this proves (2) which finishes the proof of (1).
Variations

We have shown both *termination* and *type soundness*, simultaneously. Termination would not hold if we had a fix point. But type soundness would still hold.

The proof may be modified by choosing:

\[ E(\tau) = \{ M : \tau \mid \forall N, M \rightarrow^* N \implies N \in \mathcal{V}(\tau) \lor \exists N', N \rightarrow N' \} \]

**Exercise**

*Show type soundness with this semantics.*

(Bibliography)

Mostly following Bob Harper’s course notes *Practical foundations for programming languages* [Harper, 2012].

See also

- *Types, Abstraction and Parametric Polymorphism* [Reynolds, 1983]
- *Parametric Polymorphism and Operational Equivalence* [Pitts, 2000].
- *Theorems for free!* [Wadler, 1989].

We assume a call-by-name semantics for generality of the presentation.
When are two programs equivalent

\[ M \xrightarrow{\ast} N \] ?

\[ M \xrightarrow{\ast} V \text{ and } N \xrightarrow{\ast} V \] ?

But what if \( M \) and \( N \) are functions?

Aren’t \( \lambda x. (x + x) \) and \( \lambda x. 2 \times x \) equivalent?

**Idea** two functions are observationally equivalent if when applied to *equivalent arguments*, they lead to observationally *equivalent results*.

Are we general enough?
Observational equivalence

We can only observe the behavior of full programs, i.e. closed terms of some computation type, such as B (the only one so far).

If $M : B$ and $N : B$, then $M \simeq N$ iff there exists $V$ such that $M \rightarrow^* V$ and $N \rightarrow^* V$. (Call $M \simeq N$ behavioral equivalence.)

To compare programs at other types, we place them in closing arbitrary contexts.

Definition (observational equivalence)

$$\Gamma \vdash M \simeq N : \tau \triangleq \forall C : (\Gamma \triangleright \tau) \rightsquigarrow (\emptyset \triangleright B), \ C[M] \simeq C[N]$$

Typing of contexts

$$C : (\Gamma \triangleright \tau) \rightsquigarrow (\Delta \triangleright \sigma) \iff (\forall M, \ \Gamma \vdash M : \tau \implies \Delta \vdash C[M] : \sigma)$$

There is an equivalent definition given by a set of typing rules. This is useful to proof some properties by induction on the derivations.

We write $M \equiv_{\tau} N$ for $\emptyset \vdash M \equiv N : \tau$
Observational equivalence

Observational equivalence is the coarsest consistent congruence, where:

\[\equiv \text{ is consistent if } \emptyset \vdash M \equiv N : B \text{ implies } M \simeq N.\]

\[\equiv \text{ is a congruence if it is an equivalence and is closed by context, i.e.}\]

\[\Gamma \vdash M \simeq N : \tau \land C : (\Gamma \triangleright \tau) \leadsto (\Delta \triangleright \sigma) \implies \Delta \vdash C[M] \simeq C[N] : \sigma\]

**Consistent:** by definition, using the empty context.

**Congruence:** by compositionality of contexts.

**Largest:** Assume \(\equiv\) is a consistent congruence. Assume \(\Gamma \vdash M \equiv N : \tau\) holds and show that \(\Gamma \vdash M \simeq N : \tau\) holds (1).

Let \(C : (\Gamma \triangleright \tau) \leadsto (\emptyset \triangleright B)\) (2). We must show that \(C[M] \simeq C[N]\). This follows by consistency applied to \(\Gamma \vdash C[M] \equiv C[N] : B\) which follows by congruence from (1) and (2).

Problem with Observational Equivalence

Problems

- Observational equivalence is too difficult to test.
- Because of quantification over all contexts (too many for testing).
- But many contexts will do the same experiment.

Solution

We take advantage of types to reduce the number of experiments.

- Defining/testing the equivalence on base types.
- Propagating the definition mechanically at other types.

Logical relations provide the infrastructure for conducting such proofs.
Logical equivalence for closed terms

We inductively define $M \sim_{\tau} M'$ on closed terms of type $\tau$ by induction on $\tau$:

- $M \sim_B M'$ iff $M \simeq M'$
- $M \sim_{\tau_1 \rightarrow \tau_2} M'$ iff $\forall M_1, M'_1, \ M \sim_{\tau_1} M' \implies M M_1 \sim_{\tau_2} M' M'_1$

**Lemma**

Logical equivalence is symmetric and transitive (at any given type).

**Note**

Reflexivity is not obvious at all.
Logical equivalence for closed terms

Proof by induction on type $\tau$

Case $\tau$ is $B$ for values: the result is immediate.

Case $\tau$ is $\tau_1 \rightarrow \tau_2$: By IH, symmetry and transitivity holds at types $\tau_1$ and $\tau_2$.

For symmetry, assume $M \sim_{\tau} M'$ (H), we must show $M' \sim_{\tau} M$. Assume $M_1 \sim_{\tau_1} M'_1$. We must show $M' M_1 \sim_{\tau_2} M M'_1$ (C). We have $M'_1 \sim_{\tau_1} M_1$ by symmetry at $\tau_1$. By (H), we have $M M'_1 \sim_{\tau_2} M' M_1$ and (C) follows by symmetry at type $\tau_2$.

For transitivity, assume $M \sim_{\tau} M'$ (H1) and $M' \sim_{\tau} M''$ (H2). To show $M \sim_{\tau} M''$, we assume $N \sim_{\tau_1} N''$ and show $M N \sim_{\tau_2} M'' N''$ (C).

By (H1), we have $M N \sim_{\tau_2} M' N''$ (C1).

By symmetry and transitivity at type $\tau_1$, we have $N'' \sim_{\tau_1} N''$. (Remark)

By (H2), we have $M' N'' \sim_{\tau_2} M'' N''$ (C2).

(C) follows by transitivity of (C1) and (C2) at type $\tau_2$. 
Properties of logical equivalence

Closure by inverse reduction

Assume that $N : \tau$ and $M \sim_\tau M'$.
If $N \rightarrow^* M$ and $N' \rightarrow^* M'$ then $N \sim_\tau N'$.

The proof is by induction on $\tau$.
(We show it for a single reduction step, e.g. on the left-hand side)

Case $\tau$ is $B$: By closure of behavioral equivalence $\simeq$ by inverse reduction.

Case $\tau$ is $\tau_1 \rightarrow \tau_2$: To show $N \sim_\tau M'$ we assume $M_1 \sim_{\tau_1} M'_1$ and show $N M_1 \sim_{\tau_2} M' M'_1$ (1).
From $M \sim_\tau M'$, we have $M M_1 \sim_{\tau_2} M' M'_1$. The conclusion (1) then follows by IH at type $\tau_2$, since we have $N M_1 \rightarrow M M_1$ as a consequence of the assumption $N \rightarrow M$.

Consistency If $M \sim_B M'$, then $M \simeq M'$
(Obvious, by definition.)
Logical equivalence for open terms

When $\Gamma \vdash M : \tau$ and $\Gamma \vdash M' : \tau$, we wish to define a judgment $\Gamma \vdash M \sim M' : \tau$ to mean that the open terms $M$ and $M'$ are equivalent at type $\tau$.

We write $\gamma \sim_\Gamma \gamma'$ to mean that $\gamma$ and $\gamma'$ are two substitutions of domain $\text{dom}(\Gamma)$ such that for all $x : \tau \in \text{dom}(\Gamma)$, we have $\gamma(x) \sim_\tau \gamma'(x)$

**Definition**

$$\Gamma \vdash M \sim M' : \tau \iff \forall \gamma, \gamma', \gamma \sim_\Gamma \gamma' \implies \gamma(M) \sim_\tau \gamma'(M')$$

We write $M \sim_\tau N$ for $\emptyset \vdash M \sim N : \tau$

**Immediate properties**

Open logical equivalence is symmetric and transitive.

(Proof is immediate by the definition and the symmetry and transitivity of closed logical equivalence.)
Fundamental lemma of logical equivalence

**Reflexivity** If $\Gamma \vdash M : \tau$, then $\Gamma \vdash M \sim M : \tau$.

**Proof** Assume $\Gamma \vdash M : \tau$ (1) and $\gamma \sim_\Gamma \gamma'$ (2). We must show $\gamma M \sim_\tau \gamma'M$. The proof is by induction on the typing derivation.

**Case** $M$ is $\lambda x:\tau_1. N$ and $\tau$ is $\tau_1 \rightarrow \tau_2$ with $x \not\in \gamma, \gamma'$:

We show $\lambda x:\tau_1. \gamma N \sim_{\tau_1 \rightarrow \tau_2} \lambda x:\tau_1. \gamma' N$. Assume $M_1 \sim_{\tau_1} M'_1$ (3).

We must show $(\lambda x:\tau_1. \gamma N) M_1 \sim_{\tau_2} (\lambda x:\tau_1. \gamma' N) M'_1$.

By inverse reduction, it suffices to show

$\gamma(N)[x \mapsto M_1] \sim_{\tau_2} \gamma'(N)[x \mapsto M'_1]$, i.e.

$\gamma_1(N) \sim_{\tau_2} \gamma'_1(N)$ where $\gamma_1$ is $(\gamma[x \mapsto M_1])$ and $\gamma'_1$ is $(\gamma'[x \mapsto M'_1])$ (4).

We have $\gamma_1 \sim_{\Gamma, x:\tau_1} \gamma'_1$ (5) from (2) and (3).

By inversion of typing applied to (1), we have $\Gamma, x : \tau_1 \vdash N : \tau_2$.

Thus (4) follows by induction hypothesis applied with (5).
Properties of logical equivalence

**Proof (continued)** Assume $\Gamma \vdash M : \tau$ and $\gamma \sim_{\Gamma} \gamma'$. We must show $\gamma(M) \sim_{\tau} \gamma'(M)$. The proof is by induction on the typing derivation.

- **Case $M$ is tt or ff and $\tau$ is B**: Since $M$ is closed it suffices to show $M \sim_{B} M$ which holds by reflexivity of $\sim_{B}$, i.e. of behavioral equivalence $≃$.

- **Case $M$ is $M_1 \ M_2$**: By induction hypothesis and the fact that substitution distributes over term application.

- **Case $M$ is $x$**: Immediate.
Properties of logical equivalence

Proof (continued)

Case $M$ is if $N$ then $N_1$ else $N_2$: By induction applied to $\Gamma \vdash N : B$, we have $\Gamma \vdash N \sim N : B$. Thus $\gamma N \sim_B \gamma' N$. By consistency, we have $\gamma N \simeq \gamma' N$. We reason by cases on the evaluation of $\gamma N$.

If $\gamma N \rightarrow^* \text{tt}$ then so does $\gamma' N$; then $\gamma M \rightarrow^* \gamma N_1$ and $\gamma' M \rightarrow^* \gamma' N_1$. We have $\Gamma \vdash N_1 : \tau$ by inverseion of typing. By IH, we have $\gamma N_1 \sim_\tau \gamma' N_1$. By inverse reduction, we get $\gamma M \rightarrow^* \gamma' M$.

Otherwise, $\gamma N \rightarrow^* \text{ff}$, and we proceed symmetrically.
Properties of logical relations

**Corollary (equivalence)** Open logical relation is an equivalence relation

**Corollary (Termination)** If $M : B$ then the evaluation of $M$ terminates.

Proof: $M : B$ implies $M \sim_B M$ which implies $M \simeq M$, and, in turn, implies that $M$ evaluates to either tt or ff.
Properties of logical equivalence

**Logical equivalence is a congruence**
If $\Gamma \vdash M \sim M' : \tau$ and $C : (\Gamma \triangleright \tau) \leadsto (\Delta \triangleright \sigma)$, then $\Delta \vdash C[M] \sim C[M'] : \sigma$.

**Proof** By induction on the proof of $C : (\Gamma \triangleright \tau) \leadsto (\Delta \triangleright \sigma)$.
Similar to the proof of reflexivity. (We need a definition of context typing derivations by a set of typing rules to be able to reason by induction on the typing derivation.)

**Corollary** Logical equivalence implies observational equivalence.
If $\Gamma \vdash M \sim M' : \tau$ then $\Gamma \vdash M \equiv M' : \tau$.

Proof: Logical equivalence is a consistent congruence, hence included in observational equivalence which is the coarsest such relation.
Properties of logical equivalence

Lemma
Observational equivalence of closed terms implies logical equivalence.
If \( M \simeq_\tau M' \) then \( M' \sim_\tau M' \).

Proof by induction on \( \tau \).

Case \( \tau \) is \( B \): With the empty context, we have \( M \simeq M' \), hence \( M \simeq M' \).

Case \( \tau \) is \( \tau_1 \rightarrow \tau_2 \): By congruence of observational equivalence. To show \( M \sim_\tau M' \), we assume \( M_1 \sim_{\tau_1} M'_1 \) (1) and show \( M M_1 \sim_{\tau_2} M' M'_1 \). By IH, it suffices to show \( M M_1 \simeq_{\tau_2} M' M'_1 \). This follows by congruence, from the hypothesis \( M \simeq_\tau M' \) and \( M_1 \simeq_{\tau_1} M'_1 \) which follows from (1) by the previous lemma.
Properties of logical equivalence

Corollary (Value arguments)

To show $M \sim_{\tau_1 \rightarrow \tau_2} M'$, it suffices to show that $M V \sim_{\tau_2} M' V'$ for all values $V$ and $V'$ such that $V \sim_{\tau_1} V'$.

Proof

Assume $N \sim_{\tau_1} N'$.
There exists $V$ and $V'$ such that $N \xrightarrow{*} V$ and $N' \xrightarrow{*} V'$.
It suffices to show that $M V \sim_{\tau_2} M' V'$ (H) implies $M N \sim_{\tau_2} M' N'$ (1).

We have $N \sim_{\tau_1} V$ from $N \xrightarrow{*} V$.
Then $M N \sim_{\tau_2} M V$ follows by congruence of $\sim_{\tau_2}$.
Similarly, we have $M' N' \sim_{\tau_2} M' V'$.

The conclusion (1) follows by transitivity of $\sim_{\tau_2}$ with (H).
Logical equivalence: application

Assume $\text{not} \triangleq \lambda x: B. \text{if } x \text{ then } \text{ff} \text{ else } \text{tt}$
and $M \triangleq \lambda x: B. \lambda y: \tau. \lambda z: \tau. \text{if } \text{not } x \text{ then } y \text{ else } z$
and $M' \triangleq \lambda x: B. \lambda y: \tau. \lambda z: \tau. \text{if } x \text{ then } z \text{ else } y$

Show that $M \cong_{B \rightarrow \tau \rightarrow \tau \rightarrow \tau} M'$ (C).

It suffices to show $M \ V_0 \ V_1 \ V_2 \sim_{\tau} M' \ V_0' \ V_1' \ V_2'$ whenever $V_0 \sim_B V_0'$ and $V_1 \sim_{\tau} V_1'$ and $V_2 \sim_{\tau} V_2'$.

By inverse reduction, it suffices to show

if $\text{not } V_0$ then $V_1$ else $V_2 \sim_{\tau}$ if $V_0'$ then $V_2'$ else $V_1'$

By cases on $V_0$.

Case $V_0$ is $\text{tt}$: Then $\text{not } V_0 \rightarrow^* \text{ ff}$ and thus $M \rightarrow^* V_2$ while $M' \rightarrow^* V_2$. Then (C) follows by inverse reduction and $V_2 \sim_{\tau} V_2'$.

Case $V_0$ is $\text{ff}$: is symmetric.

- Introduction
- Normalization of stlc
- Observational equivalence in stlc
- Logical relations in stlc
- Logical relations in \( F \)
Observational equivalence

We now extend the notion of logical equivalence to System F.

\[
\tau ::= \ldots | \alpha | \forall \alpha. \tau \\
M ::= \ldots | \Lambda \alpha. M | M \tau
\]

We write typing contexts \( \Delta; \Gamma \) where \( \Delta \) binds variables and \( \Gamma \) binds program variables.

Typing of contexts becomes \( \mathcal{C} : (\Delta; \Gamma \triangleright \tau) \leadsto (\Delta'; \Gamma' \triangleright \tau') \).

**Observational equivalence**

We defined \( \Delta; \Gamma \vdash M \simeq M' : \tau \) as

\[
\forall \mathcal{C} : (\Delta; \Gamma \triangleright \tau) \leadsto (\emptyset; \emptyset \triangleright B), \quad \mathcal{C}[M] \simeq \mathcal{C}[M']
\]

As before, write \( M \simeq_\tau N \) for \( \emptyset, \emptyset \vdash M \simeq N : \tau \) (in particular, \( \tau \) is closed).
Logical equivalence

For closed terms (no free program variables)

- We need to give the semantics of polymorphic types $\forall \alpha. \tau$
- Problem: We cannot do it in terms of the semantics of instances $\tau[\alpha \mapsto \sigma]$ since the semantics is defined by induction on types.
- Solution: we give the semantics of terms with open types—in some suitable environment that interprets type variables by logical relations.

For simple types, we defined logical relations and observed that

- they respect observational equivalence
- they are closed by inverse reduction

We require that relations used to interpret type variables satisfy those properties.
Logical equivalence

**Definition** A relation $R$ between closed expressions of closed types $\rho$ and $\rho'$ is admissible, and we write $R : \rho \leftrightarrow \rho'$, if:

- It respects observational equivalence: If $R(M, M')$ and $N \equiv_\rho M$ and $N' \equiv_{\rho'} M'$, then $R(N, N')$.
- It is closed under inverse reduction: If $R(M, M')$ and $N \rightarrow^* M$ and $N' \rightarrow^* M'$, then $R(N, N')$.

Given a sequence of type variables $\Delta$, let $\delta$ and $\delta'$ be maps from $\text{dom}(\Delta)$ to closed types and let $\eta$ be a map from $\text{dom}(\Delta)$ that sends each type variable $\alpha$ to an admissible relation between values of closed types $\delta(\alpha)$ and $\delta'(\alpha)$. We write $\eta : \delta \leftrightarrow_{\Delta} \delta'$ for such a relation.
Example of admissible relations

Take

\[ \Delta \triangleq \alpha \quad \delta \triangleq \alpha \mapsto B \quad \delta' \triangleq \alpha \mapsto \mathbb{Z} \]

Then \( R : \text{bool} \leftrightarrow \text{int} \) may be the \textit{closure by inverse reduction} of

\[ \{(tt, 0)\} \cup \{(ff, n) \mid n \in \mathbb{Z}^*\} \]

where integers may be used to simulate booleans.

Allows to relate values at different types.
Logical equivalence for closed terms with open types

Assume $\eta : \delta \leftrightarrow_{\Delta} \delta'$ and $M : \delta(\tau)$ and $M' : \delta'(\tau)$.

We defined $M \sim_{\tau} M' \ [\eta : \delta \leftrightarrow \delta']$ by induction on $\tau$ as follows:

$$M \sim_{B} M' \ [\eta : \delta \leftrightarrow \delta'] \iff M \simeq M'$$

$$M \sim_{\tau_1 \rightarrow \tau_2} M' \ [\eta : \delta \leftrightarrow \delta'] \iff \text{for all } N \sim_{\tau_1} N' \ [\eta : \delta \leftrightarrow \delta'],$$
$$M N \sim_{\tau_2} M' N' \ [\eta : \delta \leftrightarrow \delta']$$

$$M \sim_{\alpha} M' \ [\eta : \delta \leftrightarrow \delta'] \iff \eta(\alpha)(M, M')$$

$$M \sim_{\forall \alpha. \tau} M' \ [\eta : \delta \leftrightarrow \delta'] \iff \text{for all } \rho, \rho', R : \rho \leftrightarrow \rho',$$
$$M \rho \sim_{\tau} M' \rho'$$

$$[\eta, \alpha \mapsto R) : (\delta, \alpha \mapsto \rho) \leftrightarrow (\delta', \alpha \mapsto \rho')]$$
Logical equivalence for closed terms with open types

Assume $\eta : \delta \leftrightarrow_\Delta \delta'$ and $M : \delta(\tau)$ and $M' : \delta'(\tau)$.

We defined $M \sim_\tau M' \ [\eta : \delta \leftrightarrow \delta']$ by induction on $\tau$ as follows:

- $M \sim_B M' \ [\eta]$ iff $M \simeq M'$
- $M \sim_{\tau_1 \rightarrow \tau_2} M' \ [\eta]$ iff for all $N \sim_{\tau_1} N' \ [\eta]$, $M \ N \sim_{\tau_2} M' \ N' \ [\eta]$
- $M \sim_\alpha M' \ [\eta]$ iff $\eta(\alpha)(M, M')$
- $M \sim_{\forall \alpha. \tau} M' \ [\eta]$ iff for all $R : \rho \leftrightarrow \rho'$, $M \ \rho \sim_\tau M' \ \rho' \ [\eta, \alpha \mapsto R]$

With implicit notations...
Logical equivalence for open terms

**Definition** If $\Delta; \Gamma \vdash M, M' : \tau$ we define $\Delta; \Gamma \vdash M \sim M' : \tau$ as

$$\forall \eta : \delta \leftrightarrow_{\Delta} \delta', \forall \gamma \sim_{\Gamma} \gamma', \gamma(\delta(M)) \sim_{\tau} \gamma'(\delta'(M')) \ [\eta : \delta \leftrightarrow \delta']$$

(Notations are a bit heavy, but intuitions should remain simple.)

**Notice** We write $M \sim_{\tau} M'$ for $\emptyset; \emptyset \vdash M \sim M' : \tau$. In particular, $\tau$ is a closed type and $M$ and $M'$ are closed terms of type $\tau$. By definition, this means $M \sim_{\tau} M' \ [\emptyset : \emptyset \leftrightarrow \emptyset]$, which also coincide with the previous definition of logical relation for closed terms.
Properties

Closure under inverse reduction

If $M \sim_{\tau} M' \ [\eta : \delta \leftrightarrow \delta']$ and $N \longrightarrow^* M$ and $N' \longrightarrow^* M'$ (and $N : \delta (\tau)$), then $N \sim_{\tau} N' \ [\eta : \delta \leftrightarrow \delta']$.

Proof by induction on $\tau$.

Similar to the monomorphic case, except for:

**Case $\tau$ is $\forall \alpha. \sigma$**:

To show $N \sim_{\tau} M' \ [\eta : \delta \leftrightarrow \delta']$, we assume $R : \rho \leftrightarrow \rho'$ and show $N \rho \sim_{\sigma} M' \rho' \ [\eta, \alpha \mapsto R]$.

Since $N \rho \longrightarrow M \rho$, by induction hypothesis it suffices to show $M \rho \sim_{\sigma} M' \rho' \ [\eta, \alpha \mapsto R]$, which follows from $M \sim_{\tau} M' \ [\eta : \delta \leftrightarrow \delta']$. 
Properties

Respect for observational equivalence

If $M \sim_{\tau} M' \; [\eta : \delta \leftrightarrow \delta']$ and $N \cong_{\delta(\tau)} M$ and $N' \cong_{\delta'(\tau)} M'$ then $N \sim_{\tau} N' \; [\eta : \delta \leftrightarrow \delta']$.

Proof by induction on $\tau$.

Assume $M \sim_{\tau} M' \; [\eta : \delta \leftrightarrow \delta']$ (1) and $N \cong_{\delta(\tau)} M$ (2). We show $N \sim_{\tau} M' \; [\eta : \delta \leftrightarrow \delta']$.

**Case $\tau$ is $\forall \alpha. \sigma$:**

We assume $R : \rho \leftrightarrow \rho'$ and show $N \rho \sim_{\sigma} M' \rho' \; [\eta, \alpha \mapsto R]$. Since $N \rho \cong_{\delta(\tau)} M \rho$ (by (2) as $\cong$ is a congruence), by induction hypothesis it suffices to show $M \rho \sim_{\sigma} M' \rho' \; [\eta, \alpha \mapsto R]$, which follows from (1).
Properties

**Corollary** The relation \( M \sim_{\tau} M' [\eta : \delta \leftrightarrow \delta'] \) is an admissible relation between expressions of closed types \( \delta(\tau) \) and \( \delta'(\tau) \).

(Useful, as we may take \( \sim_{\tau} \) for the default relation.)
Properties

Lemma (respect for observational equivalence)
If $\Delta; \Gamma \vdash M \sim M': \tau$ and $\Delta; \Gamma \vdash M \cong N : \tau$ and $\Delta; \Gamma \vdash M' \cong N' : \tau$, then $\Delta; \Gamma \vdash N \sim N' : \tau$

Lemma (Compositionality)

$M \sim_{\tau[\alpha \mapsto \sigma]} M' [\eta : \delta \leftrightarrow \delta']$ iff

$M \sim_{\tau} M' [(\eta, \alpha \mapsto R) : (\delta, \alpha \mapsto \delta(\sigma)) \leftrightarrow (\delta', \alpha \mapsto \delta'(\sigma))]$

where $R : \delta(s) \leftrightarrow \delta'(s)$ is defined by

$R(N, N') \iff N \sim_{\sigma} N' [\eta : \delta \leftrightarrow \delta']$

Proof by structural induction on $\tau$.

Case $\tau$ is $\alpha$: 
Parametricity

**Theorem (reflexivity)** If $\Delta; \Gamma \vdash M : \tau$ then $\Delta; \Gamma \vdash M \sim M : \tau$.
(Also called parametricity or the fundamental theorem.)

**Proof** by induction on the typing derivation.
Properties

**Theorem**

Logical equivalence and observational equivalence coincide. 
*i.e.* $\Delta; \Gamma \vdash M \sim M' : \tau$ iff $\Delta; \Gamma \vdash M \cong M' : \tau$.

As a particular case, $M \sim_\tau M'$ iff $M \cong_\tau M'$. 
Properties

Extensionality

\[ M \cong_{\tau_1 \rightarrow \tau_2} M' \text{ iff for all } M_1 : \tau_1, \ M \ M_1 \cong_{\tau_2} M' \ M_1. \]

\[ M \cong_{\forall \alpha. \tau} M' \text{ iff for all closed type } \rho, \ M \ \rho \cong_{\tau[\alpha \mapsto \rho]} M' \ \rho. \]

Proof. Forward direction is immediate as \( \cong \) is a congruence.

Case Value abstraction: It suffices to show \( M \sim_{\tau_1 \rightarrow \tau_2} M' \). That is, given \( M_1 \sim_{\tau_1} M'_1 \) (1), we show \( M \ M_1 \sim_{\tau_2} M' \ M'_1 \) (2). By assumption, we have \( M \ M'_1 \cong_{\tau_2} M' \ M'_1 \) (3). By the fundamental lemma, we have \( M \sim_{\tau_1 \rightarrow \tau_2} M \). Hence, from (1), we get \( M \ M_1 \sim_{\tau_2} M \ M'_1 \).

We conclude (2) by respect for observational equivalence with (3).

Case Type abstration: It suffices to show \( M \sim_{\forall \alpha. \tau} M' \). That is, given \( R : \rho \leftrightarrow \rho' \), we show \( M \ \rho \sim_{\forall \alpha. \tau} M' \ \rho' \) (4). By assumption, we have \( M \ \rho' \cong_{\tau_2} M' \ \rho' \) (5). By the fundamental lemma, we have \( M \sim_{\forall \alpha. \tau} M \). Hence, we have \( M \ \rho \sim_{\tau_2} M \ \rho' \). We conclude (4) by respect for observational equivalence with (5).
Properties

Identity extension

Let $\eta : \delta \leftrightarrow \delta$ where $\eta(\alpha)$ is observational equivalence at type $\delta(\alpha)$ for all $\alpha \in \text{dom}(\delta)$. Then $M \sim_\tau M' \ [\eta : \delta \leftrightarrow \delta]$ iff $M \cong_{\delta(\tau)} M'$.
Applications

Inhabitants of $\forall \alpha. \alpha \rightarrow \alpha$

**Fact** If $M : \forall \alpha. \alpha \rightarrow \alpha$, then $M \equiv_{\forall \alpha. \alpha \rightarrow \alpha} id$ where $id \triangleq \Lambda \alpha. \lambda x : \alpha. x$.

**Proof** By extensionality, it suffices to show that for any $\rho$ and $N : \rho$ we have $M \rho N \equiv_{\rho} id \rho N$. In fact, by closure by inverse reduction, it suffices to show $M \rho N \equiv_{\rho} N$ or, equivalently, $M \rho N \sim_{\rho} N$ (1).

By parametricity, we have $M \sim_{\forall \alpha. \alpha \rightarrow \alpha} M$.

The relation $R : \rho \leftrightarrow \rho$ defined as $R(P, P')$ iff $P \sim_{\rho} N \sim_{\rho} P'$ is admissible. Thus $M \rho \sim_{\alpha \rightarrow \alpha} M \rho [\eta]$ where $\eta$ is $\alpha \mapsto R$.

By parametricity, we have $N \sim_{\rho} N$, hence $R(N, N)$, thus $N \sim_{\alpha} N [\eta]$.

Therefore $M \rho N \sim_{\alpha} M \rho N [\eta]$, i.e. $R(M \rho N, M \rho N)$, by definition of $\sim_{\alpha}$, which implies (1) by definition of $R$. 
Applications

Inhabitants of $\forall \alpha. \alpha \rightarrow \alpha \rightarrow \alpha$

**Fact** Let $\sigma$ be $\forall \alpha. \alpha \rightarrow \alpha \rightarrow \alpha$ If $M : \sigma$, then either

$M \equiv_\sigma M_1 \triangleq \Lambda \alpha. \lambda x_1 : \alpha. \lambda x_2 : \alpha. x_1$ or $M \equiv_\sigma M_2 \triangleq \Lambda \alpha. \lambda x_1 : \alpha. \lambda x_2 : \alpha. x_2$

**Proof** By extensionality, it suffices to show for either $i = 1$ or $i = 2$ that for any closed type $\rho$ and $N_1, N_2 : \rho$, we have $M \rho N_1 N_2 \equiv_\sigma M_i \rho N_1 N_2$, or, by closure by inverse reduction and replacing observational by logical equivalence that $M \rho N_1 N_2 \equiv_\sigma N_i \ (1)$.

Applications

Inhabitants of $\forall \alpha. \alpha \to \alpha \to \alpha$

**Fact** Let $\sigma$ be $\forall \alpha. \alpha \to \alpha \to \alpha$ If $M : \sigma$, then either

$$M \equiv_\sigma M_1 \triangleq \Lambda \alpha. \lambda x_1 : \alpha. \lambda x_2 : \alpha. x_1 \text{ or } M \equiv_\sigma M_2 \triangleq \Lambda \alpha. \lambda x_1 : \alpha. \lambda x_2 : \alpha. x_2$$

**Proof** By extensionality, it suffices to show for either $i = 1$ or $i = 2$ that for any closed type $\rho$ and $N_1, N_2 : \rho$, we have $M \rho N_1 N_2 \equiv_\sigma M_i \rho N_1 N_2$, or, by closure by inverse reduction and replacing observational by logical equivalence that $M \rho N_1 N_2 \equiv_\sigma N_i$ (1).

Let $\rho$ and $N_1, N_2 : \rho$ be fixed. The relation $R : B \leftrightarrow \rho$ defined as $R(P, P')$ iff $(P \sim_B \text{tt} \land P' \sim_\rho N_1)$ or $(P \sim_B \text{ff} \land P' \sim_\rho N_2)$ is admissible.
Applications

Inhabitants of $\forall \alpha. \alpha \to \alpha \to \alpha$

**Fact** Let $\sigma$ be $\forall \alpha. \alpha \to \alpha \to \alpha$. If $M : \sigma$, then either

$M \equiv_\sigma M_1 \triangleq \Lambda \alpha. \lambda x_1 : \alpha. \lambda x_2 : \alpha. x_1$ or $M \equiv_\sigma M_2 \triangleq \Lambda \alpha. \lambda x_1 : \alpha. \lambda x_2 : \alpha. x_2$

**Proof** By extensionality, it suffices to show for either $i = 1$ or $i = 2$ that for any closed type $\rho$ and $N_1, N_2 : \rho$, we have $M \rho N_1 N_2 \equiv_\sigma M_i \rho N_1 N_2$, or, by closure by inverse reduction and replacing observational by logical equivalence that $M \rho N_1 N_2 \equiv_\sigma N_i \; (1)$.

Let $\rho$ and $N_1, N_2 : \rho$ be fixed. The relation $R : B \leftrightarrow \rho$ defined as $R(P, P')$ iff $(P \sim_B \text{tt} \land P' \sim_\rho N_1)$ or $(P \sim_B \text{ff} \land P' \sim_\rho N_2)$ is admissible. Moreover, we have $\text{tt} \sim_\sigma N_1 \; [\eta]$ where $\eta$ is $\alpha \mapsto R$, since $R(\text{tt}, N_1)$ and, similarly, $\text{ff} \sim_\sigma N_2 \; [\eta]$.

We have $M \sim_\sigma M$ by parametricity.
Applications

Inhabitants of $\forall \alpha. \alpha \rightarrow \alpha \rightarrow \alpha$

**Fact** Let $\sigma$ be $\forall \alpha. \alpha \rightarrow \alpha \rightarrow \alpha$ If $M : \sigma$, then either

$M \equiv_\sigma M_1 \triangleq \Lambda \alpha. \lambda x_1: \alpha. \lambda x_2: \alpha. x_1$ or $M \equiv_\sigma M_2 \triangleq \Lambda \alpha. \lambda x_1: \alpha. \lambda x_2: \alpha. x_2$

**Proof** By extensionality, it suffices to show for either $i = 1$ or $i = 2$ that for any closed type $\rho$ and $N_1, N_2 : \rho$, we have $M \rho N_1 N_2 \equiv_\sigma M_i \rho N_1 N_2$, or, by closure by inverse reduction and replacing observational by logical equivalence that $M \rho N_1 N_2 \equiv_\sigma N_i$ (1).

Let $\rho$ and $N_1, N_2 : \rho$ be fixed. The relation $R : B \leftrightarrow \rho$ defined as $R(P, P')$ iff $(P \sim_B \text{tt} \land P' \sim_\rho N_1)$ or $(P \sim_B \text{ff} \land P' \sim_\rho N_2)$ is admissible. Moreover, we have $\text{tt} \sim_\sigma N_1 \ [\eta]$ where $\eta$ is $\alpha \mapsto R$, since $R(\text{tt}, N_1)$ and, similarly, $\text{ff} \sim_\sigma N_2 \ [\eta]$.

We have $M \sim_\sigma M$ by parametricity. Hence, $M B \text{tt ff} \sim_\alpha M \rho N_1 N_2 \ [\eta]$, i.e. $R(M B \text{tt ff}, M \rho N_1 N_2)$, which means:

$$\lor \begin{cases} M B \text{tt ff} \sim_B \text{tt} \land M \rho N_1 N_2 \sim_\rho N_1 \\ M B \text{tt ff} \sim_B \text{ff} \land M \rho N_1 N_2 \sim_\rho N_2 \end{cases}$$
Applications

Inhabitants of $\forall \alpha. \alpha \rightarrow \alpha \rightarrow \alpha$

**Fact** Let $\sigma$ be $\forall \alpha. \alpha \rightarrow \alpha \rightarrow \alpha$ If $M : \sigma$, then either

$$M \equiv_{\sigma} M_1 \triangleq \Lambda \alpha. \lambda x_1 : \alpha. \lambda x_2 : \alpha. x_1 \text{ or } M \equiv_{\sigma} M_2 \triangleq \Lambda \alpha. \lambda x_1 : \alpha. \lambda x_2 : \alpha. x_2$$

**Proof** By extensionality, it suffices to show for either $i = 1$ or $i = 2$ that for any closed type $\rho$ and $N_1, N_2 : \rho$, we have $M \rho N_1 N_2 \equiv_{\sigma} M_i \rho N_1 N_2$, or, by closure by inverse reduction and replacing observational by logical equivalence that $M \rho N_1 N_2 \equiv_{\sigma} N_i (1)$.

Let $\rho$ and $N_1, N_2 : \rho$ be fixed. The relation $R : B \leftrightarrow \rho$ defined as $R(P, P')$ iff

$$P \sim_B \text{tt} \land P' \sim_{\rho} N_1 \text{ or } (P \sim_B \text{ff} \land P' \sim_{\rho} N_2)$$

is admissible. Moreover, we have $\text{tt} \sim_{\sigma} N_1 [\eta]$ where $\eta$ is $\alpha \mapsto R$, since $R(\text{tt}, N_1)$ and, similarly, $\text{ff} \sim_{\sigma} N_2 [\eta]$.

We have $M \sim_{\sigma} M$ by parametricity. Hence, $M B \text{tt ff} \sim_{\alpha} M \rho N_1 N_2 [\eta]$, i.e.

$$R(M B \text{tt ff}, M \rho N_1 N_2),$$

which means:

$$\bigvee \left\{ \begin{array}{l}
M B \text{tt ff} \sim_B \text{tt} \land M \rho N_1 N_2 \sim_{\rho} N_1 \\
M B \text{tt ff} \sim_B \text{ff} \land M \rho N_1 N_2 \sim_{\rho} N_2 
\end{array} \right\}$$

Since, $M B \text{tt ff}$ is independent of $\rho, N_1$, and $N_2$, this actually shows $(1)$.

?
Applications

Inhabitants of $\forall \alpha. (\alpha \rightarrow \alpha) \rightarrow \alpha \rightarrow \alpha$

Fact Let $\sigma$ be $\forall \alpha. (\alpha \rightarrow \alpha) \rightarrow \alpha \rightarrow \alpha$. If $M : \sigma$, then $M \cong_\sigma M_n$ for some integer $n$, where $M_n \triangleq \Lambda \alpha. \lambda f : \alpha \rightarrow \alpha. \lambda x : \alpha. (f \alpha)^n (x \alpha)$

Proof By extensionality, it suffices to show that there exists $n$ such for any closed type $\rho$ and terms $N_1 : \rho \rightarrow \rho$ and $N_2 : \rho$, we have $M \rho N_1 N_2 \cong_\rho M_n \rho N_1 N_2$, or, by closure by inverse reduction and replacing observational by logical equivalence, $M \rho N_1 N_2 \sim_\rho N_1^n N_2$, (1).

Let $\rho$ and $N_1, N_2 : \rho$ be fixed. Let $Z$ and $S$ be $M_0$ and $M_1$.

The relation $R : \sigma \leftrightarrow \rho$ defined as $R(P, P')$ iff $\exists k$, $P \sim_\sigma S^k Z \land P' \sim_\rho N_1^k N_2$ is admissible. We have $Z \sim_\alpha N_2 [\eta]$ where $\eta$ is $\alpha \mapsto R$, since $R(Z, N_2)$.

We also have $S \sim_\alpha N_1 [\eta]$. Indeed, assume $N \sim_\alpha N' [\eta]$, i.e. $R(N, N')$. There exists $k$ such that $(N, N')$ is $(S^k Z, N_1^k N_2)$. Then, $(S N, N_1 N')$ is $(S^{k+1} Z, N_1^{k+1} N_2)$. Therefore $S^{k+1} Z \sim_\alpha N_1 N' [\eta]$. (A key to the proof.)

By parametricity, we have $M \sim_\sigma M$. Hence, $M \sigma S Z \sim_\alpha M \rho N_1 N_2 [\eta]$, i.e. $R(M \sigma S Z, M \rho N_1 N_2)$ which means that there exists $n$ such that $M \sigma S Z \sim_\sigma S^n Z$ and $M \rho N_1 N_2 \sim_\rho N_1^n N_2$. Since, $M \sigma S Z$ is independent of $n$, we in fact have (1).
Representation independence

A client of an existential type ∃α. τ should not see the difference between two implementations N₁ and N₂ of ∃α. τ with witness types σ₁ and σ₂.

A client M has type ∀α. τ → τ′ with α ∉ fv(τ′); it must use the argument parametrically, and the result is independent of the witness type.

Assume that σ₁ and σ₂ are two closed representation types and R : σ₁ ↔ σ₂ is an admissible relation between them.

Suppose that N₁ : τ[α ↦ σ₁] and N₂ : τ[α ↦ σ₂] are two equivalent implementations of the operations, i.e. such that N₁ ∼τ N₂ [η : δ₁ ↔ δ₂] where η : α ↦ R and δ₁ : α ↦ σ₁ and δ₂ : α ↦ σ₂.

A client M satisfies M ∼∀α. τ→τ′ M [η : δ ↔ δ′] and, in fact, M ∼∀α. τ→τ′ M since α does not appear free in τ′.

Thus M σ₁ N₁ ≅τ′ M σ₂ N₂. That is, the behavior with the implementation N₁ with representation type σ₁ is indistinguishable from the behavior with implementation N₂ with representation type σ₂.
(Most titles have a clickable mark “▷” that links to online versions.)
