

# Ornaments in Practice

**Thomas Williams, Pierre-Évariste Dagand, Didier Rémy**

Inria

August 29, 2014

# Motivation

Very similar data structures expressed as algebraic data types:

- ▶ trees with values at the leaves, at the nodes, etc
- ▶ GADTs encoding different invariants

Very similar functions on these structures

# Motivation

Very similar data structures expressed as algebraic data types:

- ▶ trees with values at the leaves, at the nodes, etc
- ▶ GADTs encoding different invariants

Very similar functions on these structures

Ornaments (McBride,2010)

- ▶ express the link between similar datatypes
- ▶ between operations on these types

## Naturals and lists

```
type nat = Z | S of nat
```

```
type  $\alpha$  list = Nil | Cons of  $\alpha \times \alpha$  list
```

## Naturals and lists

```
type nat = Z | S of nat  
type  $\alpha$  list = Nil | Cons of  $\alpha \times \alpha$  list
```

```
S ( S ( S ( Z )))  
Cons(1, Cons(2, Cons(3, Nil)))
```

## Naturals and lists

```
type nat = Z | S of nat  
type  $\alpha$  list = Nil | Cons of  $\alpha \times \alpha$  list
```

```
S ( S ( S ( Z )))  
Cons(1, Cons(2, Cons(3, Nil)))
```

Projection function:

```
let rec length = function  
  | Nil  $\rightarrow$  Z  
  | Cons(x, xs)  $\rightarrow$  S(length xs)  
  
ornament from length :  $\alpha$  list  $\rightarrow$  nat
```

## Valid ornaments

Intuitively, an ornament match values from an *ornamented* datatype to values of a *bare* type.

- ▶ Project the constructors from the *ornamented* to the *bare* type
- ▶ maybe forget some information
- ▶ while keeping the recursive structure of the value

An ornament is defined by a projection function, subject to some syntactic conditions described in our paper.

## Relating functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let rec append ml nl = match ml with  
  | Nil → nl  
  | Cons(x,ml') → Cons(x,append ml' nl)
```

Coherence:

$\text{length (append ml nl)} = \text{add (length ml) (length nl)}$

$\text{project (f\_lifted x y)} = \text{f (project x) (project y)}$

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append m1 n1 =
```

# Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append m1 n1 =
```

```
length m1 = m  
length n1 = n
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append m1 n1 =
```

```
length m1 = m  
length n1 = n
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append m1 n1 = match with
```

```
length m1 = m  
length n1 = n
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append m1 n1 = match | with
```

```
length m1 = m  
length n1 = n
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append m1 n1 = match m1 with
```

```
length m1 = m  
length n1 = n
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append m1 n1 = match m1 with
```

```
length m1 = m  
length n1 = n
```

## Lifting functions

```
let rec add m n = match m with
```

```
| Z → n
```

```
| S m' → S (add m' n)
```

```
let lifting append from add with
```

```
{length} → {length} → {length}
```

```
let rec append m1 n1 = match m1 with
```

```
| Nil →
```

```
length m1 = m
```

```
length n1 = n
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append m1 n1 = match m1 with  
  | Nil →
```

```
length m1 = m  
length n1 = n
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append m1 n1 = match m1 with  
  | Nil → n1
```

```
length m1 = m  
length n1 = n
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append m1 n1 = match m1 with  
  | Nil → n1
```

```
length m1 = m  
length n1 = n
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append ml nl = match ml with  
  | Nil → nl  
  | Cons(x,ml') →
```

```
length ml = m  
length nl = n  
length ml' = m'
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append ml nl = match ml with  
  | Nil → nl  
  | Cons(x,ml') →
```

```
length ml = m  
length nl = n  
length ml' = m'
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append ml nl = match ml with  
  | Nil → nl  
  | Cons(x,ml') → Cons(x, append ml' nl)
```

```
length ml = m  
length nl = n  
length ml' = m'
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append ml nl = match ml with  
  | Nil → nl  
  | Cons(x,ml') → Cons( , )
```

```
length ml = m  
length nl = n  
length ml' = m'
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append ml nl = match ml with  
  | Nil → nl  
  | Cons(x,ml') → Cons(x, append ml' nl)
```

```
length ml = m  
length nl = n  
length ml' = m'
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append ml nl = match ml with  
  | Nil → nl  
  | Cons(x,ml') → Cons(???, append ml' nl)
```

```
length ml = m  
length nl = n  
length ml' = m'
```

## Lifting functions

```
let rec add m n = match m with  
  | Z → n  
  | S m' → S (add m' n)
```

```
let lifting append from add with  
  {length} → {length} → {length}
```

```
let rec append m1 n1 = match m1 with  
  | Nil → n1  
  | Cons(x,m1') → Cons(x, append m1' n1)
```

```
length m1 = m  
length n1 = n  
length m1' = m'
```

## Filling the missing part

```
let rec append ml nl = match ml with  
  | Nil → nl  
  | Cons(x,ml') → Cons(?, append ml' nl)
```

- ▶ Manually, by intervention of the programmer
- ▶ With a *patch* specifying what should be added where
- ▶ Code inference: *x* makes the most sense here

## The other liftings

```
length (add_lifted ml nl) = add (length ml) (length nl)
```

```
let rec rev_append ml nl = match ml with  
  | Nil → nl  
  | Cons(x,ml') → rev_append ml' (Cons(x,nl))
```

```
let rec add_bis m n = match m with  
  | Z → n  
  | S m' → add_bis m' (S n)
```

## Ornaments for refactoring

```
type expr =  
  | Const of int  
  | Add of expr × expr  
  | Mul of expr × expr  
  
let rec eval = function  
  | Const(i) → i  
  | Add(u, v) → eval u + eval v  
  | Mul(u, v) → eval u × eval v
```

## Ornaments for refactoring

```
type expr =  
  | Const of int  
  | Add of expr × expr  
  | Mul of expr × expr  
  
let rec eval = function  
  | Const(i) → i  
  | Add(u, v) → eval u + eval v  
  | Mul(u, v) → eval u × eval v  
  
type binop = Add' | Mul'  
type expr' =  
  | Const' of int  
  | BinOp' of binop × expr' × expr'
```

## Ornaments for refactoring (2)

```
let rec convert : expr' → expr = function  
  | Const'(i) → Const(i)  
  | BinOp(Add', u, v) → Add(convert u, convert v)  
  | BinOp(Mul', u, v) → Mul(convert u, convert v)  
ornament from convert : expr' → expr  
  
let lifting eval' from eval with {convert} → _
```

The projection `convert` is bijective: the lifting is uniquely defined.

## Ornaments for refactoring (2)

```
let rec convert : expr' → expr = function  
  | Const'(i) → Const(i)  
  | BinOp(Add', u, v) → Add(convert u, convert v)  
  | BinOp(Mul', u, v) → Mul(convert u, convert v)  
ornament from convert : expr' → expr  
  
let lifting eval' from eval with {convert} → _
```

The projection `convert` is bijective: the lifting is uniquely defined.

```
let rec eval' : expr' → int = function  
  | Const'(i) → i  
  | BinOp'(Add', u, v) → eval' u + eval' v  
  | BinOp'(Mul', u, v) → eval' u × eval' v
```

## Lifting data structures

```
type key
val compare : key → key → int
type set = Empty | Node of key × set × set

type  $\alpha$  map =
  | MEmpty
  | MNode of key ×  $\alpha$  ×  $\alpha$  map ×  $\alpha$  map

let rec keys = function
  | MEmpty → Empty
  | MNode(k, v, l, r) → Node(k, keys l, keys r)
ornament from keys :  $\alpha$  map → set
```

## Lifting an higher-order function

```
let rec exists (p : elt → bool) (s : set) : bool =  
  match s with  
  | Empty → false  
  | Node(l, k, r) → p k  
                  || exists p l || exists p r
```

## Lifting an higher-order function

```
let rec exists (p : elt → bool) (s : set) : bool =  
  match s with  
    | Empty → false  
    | Node(l, k, r) → p k  
                      || exists p l || exists p r
```

```
let lifting map_exists from exists  
  with (_ → +_ → _) → {keys} → _
```

## Lifting an higher-order function

```
let rec exists (p : elt → bool) (s : set) : bool =  
  match s with  
  | Empty → false  
  | Node(l, k, r) → p k  
    || exists p l || exists p r
```

```
let lifting map_exists from exists  
  with (_ → +_ → _) → {keys} → _
```

```
let rec map_exists p m =  
  match m with  
  | Empty → false  
  | Node(l, k, v, r) → p k ?  
    || map_exists p l || map_exists p r
```

# GADTs

Several data structures with the same contents but different invariants, *i.e.* a constraint on the shape of the type.

Lists and vectors:

```
type  $\alpha$  list = Nil | Cons of  $\alpha \times \alpha$  list
type zero = Zero           type _ succ = Succ
type (_,  $\alpha$ ) vec =
  | VNil : (zero,  $\alpha$ ) vec
  | VCons :  $\alpha \times (n, \alpha)$  vec  $\rightarrow$  (n succ,  $\alpha$ ) vec
```

```
let rec to_list : type n. (n,  $\alpha$ ) vec  $\rightarrow$   $\alpha$  list =
  function
  | VNil  $\rightarrow$  Nil
  | VCons(x, xs)  $\rightarrow$  Cons(x, xs)
ornament from to_list : ( $\gamma$ ,  $\alpha$ ) vec  $\rightarrow$   $\alpha$  list
```

The lifting should be unambiguous.

## Lifting for GADTs

Automatic for some invariants, we only need to give the expected type of the function:

```
let rec zip xs ys = match xs, ys with  
  | Nil, Nil → Nil  
  | Cons(x, xs), Cons(y, ys) → Cons((x, y), zip xs ys)  
  | _ → failwith "different length"
```

## Lifting for GADTs

Automatic for some invariants, we only need to give the expected type of the function:

```
let rec zip xs ys = match xs, ys with  
  | Nil, Nil → Nil  
  | Cons(x, xs), Cons(y, ys) → Cons((x, y), zip xs ys)  
  | _ → failwith "different length"
```

```
let lifting vzip :  
  type n. (n,  $\alpha$ ) vec → (n,  $\beta$ ) vec → (n,  $\alpha \times \beta$ ) vec  
  from zip with {to_list} → {to_list} → {to_list}
```

## Lifting for GADTs

Automatic for some invariants, we only need to give the expected type of the function:

```
let rec zip xs ys = match xs, ys with  
  | Nil, Nil → Nil  
  | Cons(x, xs), Cons(y, ys) → Cons((x, y), zip xs ys)  
  | _ → failwith "different length"
```

```
let lifting vzip :  
  type n. (n,  $\alpha$ ) vec → (n,  $\beta$ ) vec → (n,  $\alpha \times \beta$ ) vec  
  from zip with {to_list} → {to_list} → {to_list}
```

```
let rec vzip :  
  type n. (n,  $\alpha$ ) vec → (n,  $\beta$ ) vec → (n,  $\alpha \times \beta$ ) vec  
  = fun xs ys → match xs, ys with  
  | VNil, VNil → VNil  
  | VCons(x, xs), VCons(y, ys) →  
    VCons((x, y), vzip xs ys)  
  | _ → failwith "different length"
```

# Conclusion

1. Describing ornaments by projection is a good fit for ML
2. There are ornaments in the wild
3. The automatic lifting is incomplete, but gives good and predictable results

Questions ?
